TITLE: 2. On the Mechanism of the Free Efflux of Granular Materials

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1960, Vol. 3, No. 4, pp. 18-22

TEXT: The efflux quantity of various sands and other granular materials was measured for the purpose of explaining the influence of the inclination of the container walls. The process was a free efflux from conical funnels with an opening angle of 30, 45, 60, 90 and 120° (which corresponds to an angle α of wall inclination of 75, 67.5, 60, 45 and 30°). The results shown in Fig. 1 were obtained and they agree well with one another. They show that when continuously proceeding from a container with flat bottom to a funnel, the efflux quantity even decreases, reaches a minimum at $\alpha = 45^\circ$, and increases again when α is further increased. Only with $\alpha > 55-60^\circ$ does the efflux quantity become as high as in the efflux from a container with flat bottom. Thus, this angle is considerably wider than the angle of repose which is 35-40° in the case of the materials investigated. The efflux quantity is the greater the lower is the ratio d_o / d_T . d_o denotes the diameter of the outlet, d_T the mean diameter of

the particles. The efflux quantity rises especially at $\alpha = 65-70^\circ$. This seems to be the moment when the new way of efflux begins to act, i.e. the efflux with gliding of the particles along the wall. The experiments showed (proceeding from the conceptions on the dynamic camber (Ref. 7)) that the dependence of the efflux quantity on the angle of inclination, α , of the container wall is determined only by the change of the form at the entrance to the outlet. This entrance part corresponds to the height of a truncated cone of about $0.5 d_0$. The shape of the bottom of the container has no effect upon the efflux quantity. Further experiments showed that the change in efflux quantity is caused by a velocity change or a change of the particle quantity in the layers flowing out to the periphery. On this occasion the relative increase in efflux quantity in the layers on the periphery of the jet is the greater the lower the ratio d_0 / d_T . Finally also the influence of a variation of the distance between the container walls and the outlet margins upon the efflux quantity in the case of a cylindric container with flat bottom was investigated. It has been found that the walls of a cylindric container influence the efflux quantity only when the distance between walls and outlet margin is shorter than the diameter of the outlet opening. The experiments showed that the height of the column above the

opening does not influence the outlet quantity, not even when the efflux is
accompanied by a gliding of the particles along the wall. There are 4 figures
and 7 references, 5 of which are Soviet.

AUTHOR: Zalogin, N.S.

TITLE: The effect of oxide coating and parkerizing on the running-in ability and galling of steel - chromium couples

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 9, 1961, 89, abstract 9B657 (V sb. "Povysheniye iznosostoykosti i sroka sluzhby mashin. v. 2", Kiev, AN UkrSSR, 1960, 244 - 248)

TEXT: The author presents the results of investigating the effect of oxide coating and parkerizing on the running-in ability of steel - chromium couples as well as the effect of the duration of the mentioned processes on the galling of these couples. Alkali oxide coating was carried out in a solution of the following composition (in gram/liter): NaOH - 650-700; NaNO_3 - 120; NaNO_2 - 40, at 138 - 140°C during 30 minutes. Parkerizing was effected in a 30 - 40 gram/liter solution of the "Mazher" preparation at 97 - 99°C for 40 - 50 minutes. The tests were carried out on the AE-5 (AYe-5) friction machine and on a device for the checking of the galling of metals designed by I.V. Kragel'skiy and V.I. Kostetskiy. Cylindrical test specimens were made from 30XTC A(30KhTSA) stainless steel, the rotating

disks from grade 25 steel with subsequent chrome plating in a bath of the following composition (gram/liter): CrO_3 - 250; H_2SO_4 - 2, at a current density of 50 amp/ dm^2 and a temperature of 60°C . The specimen speed of rotation was 4.5 m/sec, the load was changed in steps (200 gr every 4 minutes). The running-in ability of the friction couple was rated by the maximum load at which galling took place. The investigation results are stated in two tables. An analysis of the data obtained showed that the parkerizing and oxide coating of steel in a steel - chromium friction couple increases its efficiency. The duration of these processes should not exceed 30 - 40 minutes.

PROCESSES AND PROPERTIES INDEX

Influence of taste stimuli on the secretion of the isolated small stomach in dogs. N. V. Timofeev and L. V. Zalogina. K Neuro-Humoral'noi Regulatsii Sekretov Zheludka, Moscow, 1936, 285-77 (in English 277-8). Expts. were performed on 4 dogs with Pavlov stomach pouches. The effect of adding taste stimuli to food varied with the type and concn. of stimulating substance and with the food to which it was added. 0.1 N HCl usually decreased gastric secretion, weaker concns. increased it, the most marked effects being produced when it was added to meat, the least effect when added to bread. NaCl stimulated most markedly when 2-4 g. was added to 600 cc. of milk; when 10 or more g. was added to the same quantity of milk gastric secretion was inhibited. It had an insignificant effect when added to meat or bread. Quinine in all concns. decreased the quantity of gastric juice and increased the latent period and the duration of secretory activity when added to any food. Irrigation of the mouth with any of the taste stimuli when the gastric glands were at rest did not initiate secretion. Similar irrigation during spontaneous secretion increased the same. Since the taste stimuli (especially NaCl) when introduced directly into the stomach produce only a slight increase in gastric secretion the authors conclude that the described effects were produced by reflex taste (chem.) stimulation from the mouth (and not by the possible entrance of the stimulants into the stomach) by changing the excitability of the gastric secretory glands. S. A. Corson

TITLE: The aeroion composition of the air of hermetic chambers and its influence on the human organism 54
B+1

SOURCE: Konferentsiya po kosmicheskoy biologii i meditsine, 1964, Materialy.
Moscow, Inst. mediko-biol. problem, 1966, 35-51

TOPIC TAGS: aeroionization, human physiology, life support system, space physiology

ABSTRACT: A number of previous studies have indicated that while aeroions are of minor consequence, chronic exposure to them can lead to substantial changes in the functional condition of the organism. To further study this factor, five experiments of 20 days duration were conducted on 25 male volunteers from a laboratory (not named). The first experiment was for control purposes to obtain hygienic, chemical, and physiological data. The density of ions in this experiment ranged from 50—2000 pairs of ions/cm³. The second, third, and fourth experiments entailed exposure to positive, negative, and bipolar ions generated by "Shteynbok" radioactive ionizers. Ion concentration in the respiratory zone was 700—900 thousand ions/cm³

during experimentation. Allowing that the natural exposure dose for the lungs is 12.87 mrem/week (Sivintsev, 1960), it was calculated that 1 g of lung receives $0.33 \cdot 10^{10}$ pairs of ions per day. If, in the respiratory medium, there were 500 pairs of light ions/cm³ and 5000 pairs of heavy ions/cm³, then $0.7 \cdot 10^{10}$ light and $7 \cdot 10^{10}$ heavy pairs of ions would reach the lungs of a man during a day. In these experiments, the average subject received approximately 10^{11} pairs of light ions per day. In the fifth experiment, the chamber was de-ionized using a system of filters and special ion traps. However, complete de-ionization could not be achieved and the density was 50—60 pairs of ions/cm³. Some results of these experiments are shown in Figs. 1-6. The results of the experiment generally showed increased muscular working capacity, external respiration, and an increased level of gas exchange during exercise in the experiment with negative aeroionization. Partial normalization of some indices occurred during the respiration of negative aeroions. However, for a number of indices, a normalizing effect was also noted in response to the respiration of positive and bipolar ions. Nonetheless, the general trend of the majority of shifts noted during experimentation lends credence to the proposition that prolonged exposure to positive ions or a de-ionized air leads to some changes deleterious to human health. It is possible that an effective approach to this problem would be to combine negative ions with positive or bipolar ions. The establishment of optimum aeroion regimens requires additional research. TITLE: Results of clinical and physiological investigations of the crew of the
 first multiman Voskhod spacecraft [Paper presented at the Conference on Problems of
 Space Medicine held in Moscow from 24 to 27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy
 kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii,
 Moscow, 1966, 34-36

TOPIC TAGS: space medicine, space physiology, weightlessness, bodily fatigue,
 stress reaction, combined stress, cardiovascular system, central nervous system,
 manned spaceflight/Voskhod-1

ABSTRACT: The inclusion of a physician in the crew of the Voskhod-1 made it pos-
 sible to increase medical investigations of the crew members during
 flight and to compare them with results of preflight and postflight exami-
 nations. The scope of the physiological examinations was selected in
 order to obtain a more complete evaluation of the functional condition of
 the cardiovascular and central nervous systems, and the function of

Card 1/4

L 08269-67

ACC NR: AT6036480

external respiration of the cosmonauts. Physical exercises and ortho-static tests were included to detect earlier signs of physiological shifts.

Examinations were carried out before and after training in the ship, where certain conditions of flight were simulated, and also two weeks before flight. Postflight examination was begun fifteen minutes after landing and was continued for the first four days after the flight and also two weeks later.

After landing, the cosmonauts were active, looked somewhat excited, and complained of general fatigue. They were found to have hyperemia of the mucosa of the upper respiratory tract and conjunctivitis.

Komarov's weight dropped by 2.6%, Feoktistov's weight dropped by 4%, and Yegorov's by 3.9%. Weight loss was determined by Zhdanov to be due to water and fat loss. Neurological examination revealed a light swaying in the Romberg position, a tremor of the fingers, and increased perspiration. In addition, Yegorov showed a contraction of the retinal arteries. Disruption of vision and vestibular difficulties were not noted. Changes in EEG indicated an increase in inhibitory processes in the cortex of the brain. A diminution in work capacity was established by

Card 2/4

ACC NR: AT6036480

psychological experiments (increase in the number of mistakes, increase in latent periods).

Indices of cardiovascular activity during rest did not exceed wide norms. However, an increase in pulse frequency was noted (Komarov up to 96, Feoktistov up to 100, and Yegorov up to 94 beats/min), as well as moderate drop in arterial pulse pressure at the expense of an increase in diastolic pressure. All three cosmonauts, when subjected to exercise, showed a significant increase in the pulse rate and inertia in the stroke volume. Feoktistov and Yegorov showed a significant diminution in the heart stroke volume and minute circulation of the blood during the passive orthostatic test. This could indicate a disruption of the venous inflow to the heart.

Postflight blood examinations indicated neutrophilic leukocytosis and eosinopenia. Urine was found to contain significant quantities of salts, chiefly urates, single erythrocytes (in the field of vision), and an increase in the excretion of 17-oxycorticosteroids. Eosinopenia, an increase in excretion of products of hormone decomposition, indicated the development of a stress reaction in cosmonauts. Since some of the indications found on the flight were also found after training in the train-

ing ship, there is reason to attribute them to limitation of motor activity under conditions of weightlessness. The functional shifts found after flight are indications of a general fatigue, a moderate stress reaction, and a certain amount of detraining. In general, the changes observed in the cosmonauts were of one type. The differences found between the cosmonauts can be attributed to individual differences. [W.A. No. 22; ATD Report 66-116]

TITLE: Problem of designing a habitable spacecraft cabin environment, [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24-27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 287

TOPIC TAGS: automicroflora, closed ecological system, life support system, space cabin habitability, space hygiene, immunology

ABSTRACT:

Prolonged spaceflights require that man remain in a closed environment with an altered medium under the influence of a series of unfavorable space-flight factors. In sealed-chamber experiments with human subjects, during which certain spaceflight factors were simulated along with various work and rest schedules, in addition to physiological, psychological, and clinical observations, special attention was given to the study of the microflora of the medium, and the automicroflora and immunological reactivity of the human organism.

Cord 1/3

ACC NRI 110036658

Experiments with humans in sealed chambers have indicated that as experiments increase in duration, there is an increase in general bacteriological contamination of the surrounding medium in the chamber and that the number of pathogenic microorganisms increases significantly.

Studies of the processes of interchange of microorganisms between humans are of particular interest. Results of preliminary investigations based on phagocytic and serum studies have indicated an exchange of microorganisms between humans under these conditions.

Along with bacterial contamination of the environment, definite shifts in the immunological reactivity of the organism were noted. These shifts are characterized by disruption of the bactericidal function of the skin surfaces, depression of the phagocytic activity of leukocytes, and a reduction in the lysozyme content of the saliva.

The observed changes call attention to the need for finding methods of preventing the occurrence of infectious and autoinfectious diseases, which can arise as a result of the depression of immunological reactivity of the organism, changes in environmental microflora, and disruption of

Card 2/3

ACC NR: AT6036658

the normal microbial biocenosis in cosmonauts.

The problem of biological compatibility of microflora in relation to individual differences of space crew members deserves consideration.

TITLE: Preparation of foam polyurethanes. Class 39, No. 180794

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 8, 1966, 79

TOPIC TAGS: polyurethane, foam polyurethane, *methacrylic acid*

ABSTRACT: This Author Certificate introduces a method for preparing foam polyurethanes from hydroxyl-containing compounds, polyisocyanates, and water in the presence of a catalyst. The use of copolymers of salts of unsaturated dicarboxylic acids with methacrylic acid, such as the copolymer of methacrylic acid with potassium maleate, is suggested to increase the variety of catalysts. AUTHOR: Zalozhnev, S., Chief of Oblast Administration of Labor Reserves (Sverdlovsk)

TITLE: A Good Start (Khoroshiy pochin)

PERIODICAL: Professional'no - Technicheskoye Obrazovaniye, 1957, # 7(146), p 31 (USSR)

ABSTRACT: Among directors and their assistants there are men not proficient in any of the trades taught at their schools. It was suggested at the Oblast' Pedagogical Conference that the school staff members should learn at least one of the trades themselves. The article gives the names of several directors and deputy-directors of schools, with university educations, who have become railroad masters, assistant machinists of locomotives, lathe operators, tractor drivers etc.

PERIODICAL: Professional'no-tekhnicheskoye obrazovaniye, 1958, Nr 8, pp 7-9 (USSR)

ABSTRACT: Considerable improvements were noticed in the training of qualified workers in the Sverdlovsk Oblast, which may be attributed to the introduction of socialist competitions. As in other districts of the USSR, competitions arranged between the different schools, incited the students to greater efficiency in building machine tools, erecting buildings and taking greater interest in cultural life, as well as in raising their own general educational level.
